

# INSTRUCTIONS

- first download the folder called unit from googledrive
- install the software named "wampserver"
- after installation go to your search area normally letf-down button on windows machines.
- search wampserver first thing that appears, click on it and wait for a minute
- remove wampserver setup from "unit"(the one u hv just downloaded) folder put somewhere else
- copy unit folder to C:\wamp\www (meaning local disk 'c' then wamp then www save it there)
- open your browser and write in the address bar these words( localhost ) without brackets
- a page should be coming up
- look for where it is written 'phpmyadmin' click on it u will now see some window opening up
- on the left side bar click **new** >>>>> refer to image

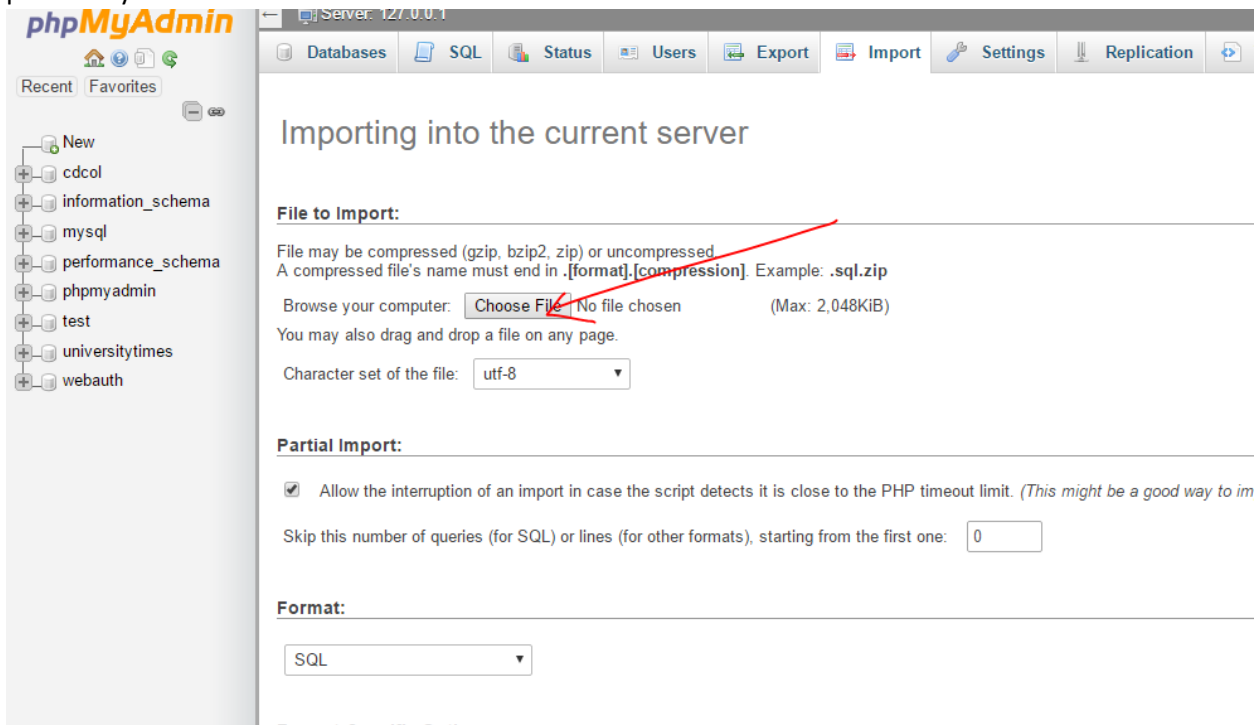

-create a database called universitytimes (make sure u write it like this)

-after this is created on the left side bar click on where u see universitytimes

-click import button refer to image above

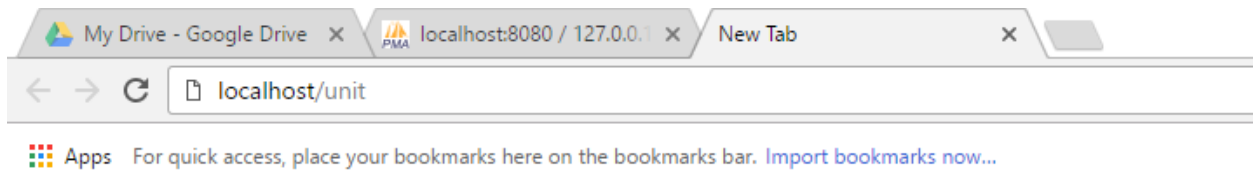

- click choose file -- navigate to your unit folder that u downloaded choose **universitytimes.sql** file  
press okay

-hit go

-if that is done

-close your browser and open it again this time write localhost/unit in ur address bar hit enter on your keyboard

-the site must be appearing if not we shall talk on phone

## PART2: Updates

I have been writing lots of code to make this site more database driven so u might not see much visual improvements this took me a lot of time but trust me after making the administrator panel this whole project will be done

- write **localhost/unit/employees/reporter.php** : this is where u will be posting your stories from.

-write **localhost /unit/employees/login\_employee.html**: this is where u will be registering your employees from.

If you want to see the rest of the pages write :

**localhost/pages/technology.html**

**localhost/pages/single.html**

**localhost/pages/contact.html**
